

**AMENDMENTS TO THE CLAIMS**

1. (Currently Amended) A process for encoding a boarding pass with an image of a passenger to facilitate identify verification, comprising the steps of:

verifying the identity of the passenger prior to the boarding and at a location beyond a security perimeter;

taking an electronic image of the passenger with a camera capable of generating a computer-storage image output; and

printing a human-cognizable image of the passenger directly onto said boarding pass;  
associating said computer-storable image output with an individualized travel datum of the passenger;

storing said computer-storage image output associated with said electronic image in a centralized database; and

retrieving said computer-storage image output as said human-cognizable image on a video display in response to entry of an individualized travel datum of the passenger into a computer in communication with said centralized database.

2. (Canceled)

3. (Previously Presented) The process of claim 1 wherein printing said human-cognizable image onto said boarding pass occurs with an ink color associated with a particular transport departure.

4. (Canceled)

5. (Original) The process of claim 1 wherein printing said human-cognizable image occurs with a non-smudgeable ink.

6. (Canceled)

7. (Original) A travel boarding pass system for verifying the identity of a bearer, comprising:

a self-supporting boarding pass having a human-cognizable image of the bearer printed thereon, the human-cognizable image being printed in an ink color associated with a transport departure of the bearer.

8. (Previously Presented) A travel boarding pass system for verifying the identity of the bearer, comprising:

a self-supporting boarding pass having a machine readable data series selected from the group consisting of: bar code and magnetic strip encoding an alphanumeric code independent of a human cognizable image of the bearer;

a computer database storing a bearer image associated with the reference number; and

a video display coupled to said computer database and a machine data reader adapted to read the data series, such that upon reading the data series a human-cognizable bearer image is displayed on said video display.

9. (Previously Presented) A process for encoding a boarding pass with an image of a passenger to facilitate identify verification, comprising the steps of:
  - verifying the identity of the passenger prior to the boarding;
  - taking an electronic image of the passenger with a camera capable of generating a computer-storable image output;
  - encoding a machine readable data series selected from the group consisting of: bar code and magnetic strip onto a boarding pass, said data series referencing said computer-storable image output within a computer independent of a human cognizable image of the passenger on said boarding pass;
  - reading the data series to said computer database;
  - recalling a human-cognizable image of the passenger from said computer-storable image output, said computer-storable image output referenced to said data series with said computer database;
  - displaying said human-cognizable image on a video display interfaced with said computer database; and
  - comparing the human-cognizable image on said video display with the passenger presenting said boarding pass at the time of boarding.
